Recent Projects

OmniClip

OmniClip started as a discord bot that focused on creating short videos for social media platforms using ChatGPT to generate CTAs / quotes and other text to speech AI services, such as 11labs, to generate voiceovers for the videos. This repo is an approach to turning this discord bot into a web application. The web application allows users to upload their own media files and automatically compiles them into short videos. These videos can then be downloaded by the user.

I used Flask as the framework for this web application as the original discord bot was written in Python. On the frontend, I used vanilla JS with ES6 modules coupled with raw HTML / CSS. I used ffmpeg for the compilation of media files, which was a design change I suggested from the original discord bot. FFmpeg is much lower level and has performance benefits over the libraries that were being used when I joined the project.

The Domain Designers

The Domain Designers is a web development agency that I hope to expand in my free time. I focus on collecting small businesses as potential clients. I offer building simple web applications, ecommerce platforms, and static websites for clients, depending on their business needs.

I am always trying to add to the portfolio section for this website. There are other projects related to this agency linked there.
